

Quality

Snags, inspections and NCRs

Purpose

Keep quality issues visible and closed out: the snag / punch list tracks defects to re-verification, inspections record structured checklist results, and NCRs capture non-conformances formally.

Key functions

- **Snag / punch list** — raise with priority (including critical), assign, track status through to retest and close.
- **Inspections** — build a checklist, record pass/fail per item, finalize the inspection.
- **NCRs** — raise non-conformance reports and move them through a status workflow.
- Work is linked to the responsible project, with owner and due date.
- Notifications to the team when items are raised or assigned.

How to use it

1. In **Quality**, choose Snag, Inspections or NCRs.
2. Create the record with project, priority and assignee.
3. Progress it through the status transitions as work is done.

Tip: use the **AI Assistant's Draft** feature to convert a rough note into a structured snag/NCR entry, then review and save it here.
