

Work Permits (ePTW)

Electronic permit-to-work with risk-based approvals

Purpose

Digitalize the permit-to-work process: request, review, approve, execute, suspend and close — with the approval chain matched to the assessed risk of the activity.

Key functions

- **Permit types** and work description per task.
- **Risk-based approval chain** — higher-risk work requires more senior approval levels automatically.
- **Checklist items** to be confirmed before work starts (e.g. area cleared, extinguishers staged).
- Full lifecycle: submit, approve/reject, start, suspend, resume, close.
- Approval history and comments kept on every permit.

How to use it

1. Open **Work Permits (ePTW)** and **Create** a permit for the activity.
2. Add the required checklist items and submit.
3. Approvers review and decide; pending approvals appear on the dashboard.
4. Once approved, **Start** the permit — and **Suspend / Resume / Close** as the work dictates.

Tip: suspend a permit whenever conditions change (weather, isolations, staffing) — resuming re-activates the same approval record instead of a re-submission.
