

AI Assistant

Ask about your data · auto-draft records

Purpose

The Assistant makes FieldSuite faster to operate. It answers questions drawn from your own project data and produces structured entry drafts from plain-text notes. It is designed to work **offline by default** (rules-based, no data leaves your workspace), with an LLM enhancement only when configured.

Key functions

- **Ask** — ask questions about incidents, permits, snags, estimates and attendance; answers cite your organization's data.
- **UsedLlm flag** — the reply indicates whether the response came from the offline rules engine or the configured LLM.
- **Draft** — turn a rough note into a structured incident / snag / NCR entry (title, description, category, severity).
- Drafts are for *review* — you save them through the normal module forms.

How to use it

1. Open **AI Assistant** in the sidebar.
2. Type a question such as *"Which permits are awaiting approval?"* and view the answer.
3. Paste a rough note and pick Draft type to get a structured entry; copy it into the module form and adjust if needed.

Privacy note: offline mode means your data is processed by the rules engine within your workspace. Enable an LLM only if your organization accepts cloud processing.
